The Rice Situation

WHEAT PRODUCTION

FOUR MAJOR EXPORTING COUNTRIES AND EUROPE

* EXCLUDES U.S.S.R.

U. S. DEPARTMENT OF AGRICULTURE

NEG. 1410-0

OFFICE OF FOREIGN AGRICULTURAL RELATIONS

Total estimated wheat production in the four principal exporting countries of United States, Canada, Australia and Argentina, together with Europe, in 1951 is about unchanged from 1950. Increases in Canada and Europe about offset reductions in Argentina, Australia and United States.

European wheat production was greatly reduced by World War II. In the postwar period United States production was greatly expanded to meet European

and world needs. Some expansion also took place in Australia.

The upward trend of European production during the twenties and the thirties corresponds rather closely with the decline in world trade that occurred, particularly in the thirties. The four principal exporting countries, together with Europe, have accounted for the bulk of the world trade in wheat and flour.

RICE: WORLD TRADE

EXPORTS

IMPORTS

World rice exports in 1950 were about half those of the 1936-40 period. The principal country and area changes include the sharp decline in shipments from Indochina, Korea and Formosa, and increases for the Western Hemisphere, Thailand (Siam) and

miscellaneous countries. For imports, the principal changes include a sharp decline for Europe and Japan in tonnage and percent of trade and an increase in the share of imports by Asia, though tonnage declined.

THE WHEAT SITUATION- Including Rice -

Approved by the Outlook and Situation Board, December 3, 1951

SUMMARY

Production of wheat in the United States in 1951, now estimated at 994 million bushels, is less than is likely to be used in this country and exported in 1951-52. It is expected that the carry-over on July 1, 1952 will be about 60 million bushels below stocks last July and about equal to the 1941-50 average of 334 million bushels.

Total supplies of wheat in 1951-52 are now estimated at 1,430 million bushels, consisting of a carry-over of old wheat of 396 million bushels and allowance for imports of feeding-quality wheat of about 40 million bushels in addition to the 1951 production. With domestic wheat disappearance estimated at about 730 million bushels and exports expected to total at least 365 million bushels, the carry-over July 1, 1952 may be reduced to about 335 million bushels.

In every year since the loan program was inaugurated in 1938, wheat prices have advanced to above the loan level. This year the rise occurred earlier than usual. The price of No. 2 Hard Winter Wheat at Kansas City on November 30 was \$2.54 per bushel, about 17 cents above the effective loan level and about 27 cents above the low reached on July 25. The price of No. 1 Dark Northern Spring at Minneapolis was \$2.53, about 14 cents above the effective loan. The strength in wheat prices this year has resulted from large United States exports and widespread unfavorable harvesting conditions in exporting countries.

World wheat production is now forecast at about 6.6 billion bushels, compared with 6.3 billion in 1950 and the 1935-39 average of 6.0 billion. The wheat crop in the traditionally deficit area of western Europe is smaller than that of 1950, increasing import needs in most of these countries. Spain is the outstanding exception for the area. Production there appears to be well above the 1950 harvest. A larger part of Europe's imports this season will come from the Northern Hemisphere exporters, since both Argentina and Australia are expected to have smaller crops than in 1950-51.

World trade in wheat and flour in 1951-52 is expected to total about 900 million bushels or slightly above the 890 million bushels estimated for 1950-51. Exports from the four principal exporting countries--United States, Canada, Australia and Argentina--are expected to total about 800 million bushels, compared with 816 million a year earlier. Other countries, including the Soviet Union, may total about 100 million bushels, compared with about 75 million a year earlier.

A United States rice production goal for the 1952 crop of 42 million hundredweight has just been announced. With average yields, the seeding of 1,950 thousand acres will be required to meet this goal. Such an acreage would be very little below the record 1,962 thousand acres seeded in 1951 and would be 14 percent larger than the average acreage seeded in 1946-50. A more active demand for United States rice is already apparent for 1951-52. While no substantial reduction in the production of rice in the United States is recommended for 1952, the present acreage available for rice production exceeds our probable long-time rice requirements, both export and domestic, and the development of new rice areas does not appear to be warranted.

THE DOMESTIC WHEAT SITUATION

BACKGROUND - Unusually large exports of bread grains absorbed more than the excess over domestic needs for the billion-bushel wheat crops produced annually in the United States in 1944-48. Large U. S. exports also have held down the increase in the size of the carry-over since then. Exports of wheat during the marketing years 1945-46 through 1948-49 averaged 444 million bushels, but declined to 299 million bushels in 1949-50. Largely as a result of the war in Korea and reduced exports of milling quality wheat from Canada, exports from the United States in 1950-51 increased to 366 million bushels.

In 1932-41, the average supply of wheat in continental United States was 982 million bushels, consisting of a carry-over of old wheat, 235; production, 738, and imports for domestic use, 9. Total disappearance averaged 721 million bushels consisting of food, 486; feed 111; seed, 81; and exports to foreign countries and shipments to U. S. Territories, 43. Carry-over stocks at the end of this period were much larger than at the beginning, reflecting the large 1941 crop.

Wheat prices to growers advanced from an average of 67 cents per bushel in 1940-41 to a record season average of \$2.29 for the 1947 crop. The highest monthly price was \$2.81 in mid-January 1948. From 1938 to late 1944 the level of the loan rates under the support programs which reflected the general rise in prices farmers pay was the most important factor in domestic wheat price. From 1942 through 1945 wheat feeding was exceptionally heavy and large quantities of wheat were used for industrial purposes. Beginning in early 1945, export demand, influenced by the various foreign aid programs, became a very important price factor (table 4).

In 1947-48, United States wheat prices reflected strong world import demand resulting from short crops in many importing countries. With the harvest of the near-record crop in 1948 and relatively large crops in importing countries the loan program again became an important price factor along with large export demand. The price to growers for the 1948-49 crop averaged about 1 cent below the \$2.00 loan level, in 1949-50 about 7 cents under the \$1.95 loan, and in 1950-51 about 1 cent above the \$1.99 loan.

Carry-over July 1, 1952 May be
About 335 Million Bushels

Supplies of wheat in 1951-52 were estimated as of November 1 at 1,430 million bushels. The July 1 carry-over of old wheat was 396 million bushels and the 1951 crop is estimated at 994 million bushels. An allowance has been made for imports of about 40 million bushels of feeding-quality wheat.

Domestic wheat disappearance may total about 730 million bushels, consisting of the following, in million bushels: Food (Continental United States 1/ territories, and military use), 500; feed, including Canadian wheat, 140; seed 88; and industrial use at least 2. With exports estimated at about 365 million bushels, the carry-over July 1, 1952 is indicated at 335 million bushels. This is about equal to the 1941-50 average of 334 million bushels, but about 60 million bushels below the 396 million last July.

Table 1 shows wheat supply and distribution 1909-51, using actual exports (ship loadings). Table 2 includes, in addition to commercial actual exports, procurement for export by the military for civilian relief feeding and by the USDA for non-military shipments. While the computation of procurement basis is more accurate for any one year, in that wheat may be purchased in one year and exported in another, the computation on the export basis is simpler and usable for most purposes.

Supplies of Winter Wheats
Below Average; Hard Red Spring
and White Above Average

The total estimated 1951 wheat crop consists of the following, in million bushels (1950 in parenthesis); Hard red winter 382 (471), soft red winter 158 (166), hard red spring 262 (207), durum 37 (37), and white 155 (146).

Table 3 shows supply and distribution of wheat by classes, 1941-51. With supplies of hard red winter substantially below that of recent years, proportionately larger quantities of hard spring wheat will be exported and probably used domestically. Durum supplies are only slightly below a year ago, while supplies of white wheat, the export type in the Pacific Northwest, is larger than a year ago.

While supplies of soft red winter wheat are below those of recent years, they are sufficient to take care of domestic requirements. With the July 1 carry-over estimated at 24 million bushels and a crop estimated at 158 million, supplies total 182 million. This is about equal to the 1939-48 average domestic disappearance of 180 million bushels, and is considerably above small estimated domestic disappearance of 143 million bushels in 1950-51.

Supply and disposition of wheat in the Pacific Northwest, 1947-51, is shown in table 6.

1/ Civilian consumption of flour in 1950-51 (table 15) on the basis of revised grind figures published by the Bureau of the Census, now totals 202 million hundredweight. This amounts to 133 pounds per capita compared with 136 pounds one year earlier and 137 two years earlier.

Wheat Exports in July-September Large;
Quantities Fed Small

Total disappearance of wheat in the July-September quarter is estimated at 272 million bushels and includes the following estimates, in million bushels; Food, 120; exports, 111; and seed, 30. This leaves about 11 million bushels as a residual for feed and waste, one of the smallest for any quarter on record. Exports, including wheat and flour and other products, in July-October totaled 150 million bushels, compared with 70 million a year earlier. During 1950-51, exports were much smaller in July-December than in January-June; and it is expected that the reverse will be the case this year. Last year it was not recognized that the supply of contract-grade wheat in Canada was relatively short until about January when purchases by importing countries were stepped up because of the likelihood of higher prices.

The disappearance of 272 million bushels compared with 247 million for the same quarter in 1950, 285 million in 1949, and 348 million in 1948. Total supply of wheat available during the third quarter was 1,399 million bushels-- the July carry-over plus crop, and imports of 9 million bushels. This left stocks on October 1 at 1,127 million bushels.

Wheat Prices Rise Earlier Than Usual

In every year since the loan program was inaugurated in 1938, wheat prices have advanced to above the loan level. This year the rise occurred earlier than usual. ^{2/} On November 30, the price of No. 2 Hard Winter Wheat at Kansas City was \$2 54. This is 10 cents over the \$2.44 gross loan level (17 cents after deductions for storage), and 27 cents above the low of \$2.27 reached on July 25. Prices at St. Louis were 15 cents above the gross loan and those at Minneapolis were 7 cents above. Prices received by farmers for wheat in mid-November averaged \$2.19--one cent above the announced gross loan rate. This price compares with \$2.10 a month earlier and \$1.94 mid-November 1950. The wheat parity price in mid-November was \$2.43, 1 cent higher than a month earlier and also one cent higher than at the beginning of the marketing year, when the loan was established on the 1951 crop.

The strength in wheat prices this year has resulted primarily from large United States exports and widespread unfavorable harvesting conditions in exporting countries. If sales by producers continue in substantial quantities, together with completion of wheat agreement sales under the United States quota, there will be a tendency for prices to level off. The increase in income taxes after January 1, 1952 may be a factor in maintaining the level of producer sales through December.

Through October, farmers had placed 165 million bushels of wheat under loan and purchase programs; compared with 189 million a year earlier. The total quantity from the 1950 crop placed under the programs was 196 million bushels (table 12). Farmers have until January 31, 1952 to make application for loans and purchase agreements. Price support loan repayments were small until late November.

^{2/} In the three years beginning with 1945-46 prices were above the loan throughout the year reflecting strong foreign demand.

Market strength is also derived from strong foreign demand for United States wheat. Exports for the 1951-52 marketing year are expected to at least equal the large 1950-51 total of 366 million bushels. Because of a delayed harvest, and marketing and transportation difficulties, Canada was able to move only a small portion of its near-record 1951 production, into export positions before the close of lake navigation. In 1950-51 Canadian exports were reduced because of short supplies of good-milling quality wheat as well as transportation difficulties. Trade will also be diverted to the United States as a result of the near crop failure in important producing areas of Argentina and the small crop in Australia. The harvests in both of these countries are now in progress. Less than four months of the International Wheat Agreement year have passed, and substantially more than half of the United States quota of 255 million bushels has been sold (table).

Prices of high quality milling wheat are especially strong because the percentage of wheat in the higher grades is smaller than usual. The quality of both winter and spring wheat was reduced by unfavorable weather at harvest time.

The Outlook for 1952 Wheat Brief Revised Statement

A national wheat goal for 1952 of 78.9 million acres was announced on July 13. This allowed ample time for farmers to plant their fall seedings. This goal acreage is slightly above the big acreage of 78.5 million acres seeded for the 1951 crop, and has been exceeded by seedings in only four years in our history.

If yields for next year's wheat crop are average, the 78.9 million goal acreage would result in a crop of 1,165 million bushels, 17 percent above estimated production this year when yields were below average. It is likely that the goal acreage will be fully met, if not exceeded. A crop of about 1,165 million bushels, a carry-over of old wheat on July 1, 1952 estimated at about 335 million bushels, and imports, now tentatively placed at 25 million bushels, would provide 1,525 million bushels of wheat for 1952-53. Use of wheat in the United States in 1952-53 is forecast at about 745 million bushels. Assuming exports of as much as 350 million--moderately less than the 365 million expected for 1951-52--the carry-over on July 1, 1953 would be about 430 million bushels. This would be about 100 million bushels more than is expected to be carried over next July 1. To the extent that the allowance for exports is not realized, however, the carry-over would be additionally increased.

The price to growers for the 1952 wheat crop is expected to average near the support level established at the beginning of the marketing year. A minimum support price of \$2.17--about the same as for the 1951 crop--was announced by the Secretary of Agriculture on August 29. This was 90 percent of the mid-July parity price. If 90 percent of parity at the beginning of the marketing year is higher, the support will be raised to that level. As was the case in 1951, no allowance for farm storage or warehouse storage charges will be available to producers who deliver loan wheat from the 1952 crop to CCC. On July 29 Secretary Brannan announced that there would be no marketing quotas on the 1952 wheat crop.

THE CURRENT WORLD WHEAT SITUATION

BACKGROUND.- On July 1, 1943, stocks of wheat in the 4 principal exporting countries, United States, Canada, Australia and Argentina, were a record of 1,737 million bushels, almost 4 times the 1935-39 average of 458 million. By July 1945, however, they were down to 818 million bushels, and by July 1946 they had been further reduced to 387 million. Greatly increased disappearance was caused by wartime depletion of food supplies in importing countries and by poor crops in many areas. Stocks in the 4 countries on July 1, 1946 were the smallest since 1938 and about 16 percent less than the 1935-39 average. By July 1950 these stocks had increased to 787 million bushels, and on July 1, 1951 they were 800 million.

559
World Trade in Wheat and Flour in 1951-52
May Slightly Exceed Year Earlier

1172
 World trade in wheat and flour in 1951-52 is expected to total about 900 million bushels, or slightly above the 890 million bushels estimated for 1950-51 and 886 million in 1949-50. In both years trade was less than the 968 million-bushels record in 1948-49, as a result of the improved grain situation in many importing countries. 892

Exports of wheat and flour from the four principal exporting countries - United States, Canada, Australia and Argentina - are expected to total about 800 million bushels in 1951-52 compared with 816 million in 1950-51, 716 million in 1949-50, and 908 million in 1948-49. Other countries, including the Soviet Union are expected to export about 100 million bushels in 1951-52, compared with about 75 million one year earlier, about 125 million two years earlier and about 60 million in 1948-49.

Of the 816 million bushels of wheat and flour exported by the four countries in 1950-51, the United States led with 365 million (298 million in 1949-50), Canada was second with about 221 million bushels (263 million). Australia was next with 127 million (114 million); and Argentina was last with 103 million (86 million).

World Wheat Production Above 1950 and Above Prewar 4/

World wheat production is now forecast at about 6.60 billion bushels, compared with 6.32 billion in 1950 and the 1935-39 average of 6.02 billion. The wheat crop in the traditionally deficit areas of western Europe is smaller than that of 1950, increasing import needs in most of these countries. Spain is the outstanding exception. Production there appears to be considerably larger than the 1950 harvest. A larger part of Europe's import needs this season will depend upon supplies from the Northern Hemisphere exporters, since both Argentina and Australia are expected to have smaller crops than in 1950. Prospects are below average in both countries because of reduced acreage and unfavorable growing conditions.

In North America wheat production is estimated at 1.6 billion bushels. This one of the largest wheat crops of record for the Continent -- exceeded only in 1947 and 1948. A near record crop of 562 million bushels is in prospect for Canada, while the United States crop is almost a billion bushels following 7 successive crops of over a billion bushels.

4/ Adapted from Foreign Crops and Markets, Sept. 24, 1951, published by Office of Foreign Agricultural Relations, USDA.

Larger than average carry-over stocks in both the United States and Canada bring the total supply for the current season to about 2.2 billion bushels. This is larger than a year ago, but falls below the record of 2.6 billion bushels in 1942. The current large supply would provide about 1.3 billion bushels for export or carry-over after supplying normal domestic requirements. However, limitations of transportation in Canada, both rail and lake, can be expected to hold actual exports in the 1951-52 season considerably below total availabilities. Also a substantial part of the larger carry-over stocks in Canada consist of frosted wheat that is expected to be used principally for feed.

Canada's 1951 wheat crop, currently estimated at 562 million bushels, is slightly more than 100 million greater than the 1950 outturn and second only to the record 567 million harvested in 1928. In the Prairie Provinces the wheat crop is placed at 531 million bushels as against 427 million last year and the record of 545 million in 1928. However, realization of the current estimate, will be possible only if the unthreshed part of the crop remains in reasonably good condition and can be harvested without significant loss. According to current reports, only about two-thirds of the harvesting in the Prairie Provinces had been completed when early winter conditions set in mid-October. Loss in grade is already evident from the effects of excessive moisture. However, it is anticipated that the proportion of million grades in the current crop will be considerably higher than in 1950. Included in the western wheat crop is a small proportion of winter wheat grown chiefly in Alberta. The 1951 production of wheat in the remainder of Canada is placed at some 31 million bushels, with Ontario's outturn of 26.5 million (of which 25.5 million is winter wheat) accounting for the principal part.

Total wheat production in Europe in late September was forecast at 1,565 million bushels. This compares with 1,520 million in 1950 and the 1935-39 average of 1,599 million. Conditions were less favorable than last season in most of the western European countries. Reductions appear greatest in Italy, France and the United Kingdom. In addition, the Low Countries report smaller harvests as did Scandinavia. Spain, in contrast, reports the largest crop since 1934. This largely offsets reductions in the other principal producing countries of western Europe.

Conditions in central and eastern Europe were better than in 1950, especially in the Balkans, where drought last year reduced crops. Yields in Yugoslavia and Rumania are reported considerably larger than those of a year ago. Larger crops also are reported for Hungary, Bulgaria, and Greece. Some increase over the 1950 harvest is reported for western Germany and also seems in prospect for Poland, Czechoslovakia, and eastern Germany.

Information on the Soviet Union substantiates earlier reports of prospects for a larger wheat crop than in 1950. However, a smaller rye crop is estimated with some shift from rye to wheat acreage taking place. Trade agreements for the current marketing season appear to reflect a larger wheat crop. The most recent was the agreement with the United Kingdom which calls

for delivery of 200,000 tons of wheat out of a total of one million tons of grain. Wheat was not included in the previous Soviet-British trade agreements. Other bilateral agreements entered into by the Soviets in recent months include one with Egypt calling for an exchange of wheat for Egyptian rice and cotton and an agreement to supply India a moderate quantity of wheat.

The wheat harvest in Asia is expected to be about 5 percent larger than the good 1950 outturn. Reported increases for Turkey and China account for the bulk of the increase. Crops in Japan and Manchuria were also reported better than in 1950. These substantial increases more than offset reductions in most countries of the Middle and Near East. Widespread drought reduced outturns in many of these countries. Latest reports indicate little change from the 1950 wheat harvest in India and Pakistan. Definite information on 1951 production is not available, but indications point to some increase over the large 1950 outturn.

The wheat crop in Africa is estimated to be smaller than in 1950. Unfavorable conditions in Algeria and Tunisia reduced harvests significantly in these two countries. The reductions were only partly offset by increased production in Egypt and a small increase in French Morocco. Prospects are good for the crop in the Union of South Africa, where harvesting begins in November, and the production may approach the record harvest of a year ago.

It is still early for definite information on the crop in South America, but prospects are sharply below those at this time a year ago. Reduced acreage in Argentina is an important factor in the over-all outlook, since Argentina normally accounts for 75 to 80 percent of the continental total. The wheat acreage in that country is forecast at a maximum of about 11 million acres, 5 million under seedings for the past year and 7 million acres less than in 1941-42. Severe drought cut seedings in the northern wheat zone of Cordoba and Sante Fe by about 2.5 million acres. In the southwestern zone, near Bahia Blanca, the soil was reported dry and difficult to work without tractors, which reduced the area seeded there by another 2.5 million acres. Moderate reductions are reported in several minor producing zones. Present prospects point to a wheat outturn of about 125 million bushels, one of the smallest of record contrasting with last year's crop of 213 million bushels and the 1940-44 average of 235 million. At this level the crop would only approximate domestic requirements with little surplus for export.

The wheat crop in Australia is tentatively forecast at between 150 and 160 million bushels. This would be the smallest outturn since 1946-47 and about 15 percent below the 1950-51 crop of 184 million bushels. The reduction from last year's crop is mainly attributed to reduced acreage, with no significant change in yields expected. The current acreage sown to wheat for grain is estimated at 10.2 million acres, compared with 11.7 million a year ago and 13 million during the 5 years ended 1938-39. At that low figure the current acreage would be the smallest since 1944-45. Wheat acreage has declined steadily since the postwar record of 13.9 million acres in 1947-48. The further decline this year was caused by economic factors and adverse weather conditions.

THE RICE SITUATION AND OUTLOOK

BACKGROUND: - The acreage seeded to rice in the United States in 1951 totaled 1,959 thousand and the production is currently estimated at 44.6 million hundredweight--both all-time records. During 1946-50, the acreage seeded to rice averaged 1,715 thousand acres and the production averaged 37 million cwt. (table 17).

The 1951 acreage is almost double the 1935-39 average of 1,007 million acres. Production in the United States was increased when exports from Asia were cut off by the war. This trade has been only partly restored, and was only 47 percent of prewar in 1950. The increase in United States acreage is not significant in relation to the total world supply, since the United States produces only a little over 1 percent of the total. However, from the standpoint of trade, United States rice exports in 1950 were 11 percent of the total rice entering world trade compared with 1 percent in 1936-40. This is the result of a 5-fold increase in United States exports and a sharp drop in world trade.

Rice is one of the world's most important food grains and normally provides one-fifth of the world's food supply. Rice production in 1950 ^{5/} estimated at 343 billion pounds, was almost 90 percent as large as the world wheat production, estimated at 384 billion pounds. Before the war, about 95 percent of the world's supply of rice was produced in southern and eastern Asia and nearby territory. Burma, Thailand, French Indo-China and Korea were the principal exporters, and Japan, India, Ceylon, British Malaya, and China the largest importers. During the war, rice production was increased in the Western Hemisphere and Egypt.

Rice Prices Approaching Loan Level

Rice prices received by farmers averaged \$4.00 per hundredweight in mid-September, \$4.71 in mid-October, and \$4.88 in mid-November, compared with the loan of \$5.00. The price received by growers for the 1950 crop averaged \$5.24, which was above the \$4.56 loan. U. S. No. 1 Zenith at New Orleans for November was \$9.45 per cwt. milled, compared with \$9.90 a year earlier, and U. S. No. 2 California Pearl at San Francisco for the same month was \$8.45 milled, compared with \$8.90 a year earlier. Prices in these markets and prices received by farmers are shown in table 18.

Early season prices were below the support level because of the record large production, and difficulties in obtaining approved storage. This is the fourth year in which farmers have availed themselves of the price-support programs. Through October, farmers had placed 869 thousand cwt. under the loan program and 135 thousand under purchase agreements. In all of 1950-51 when prices were above the loan, only 790 thousand cwt. were placed under both programs.

U. S. Rice Supplies at Record Level

U. S. supplies of rice for 1951-52 in terms of milled rice total 31.19 million cwt. ^{6/} This exceeds the previous record of 27.17 million cwt. by 15 percent. Old crop stocks at the beginning of the marketing year (August 1 in

^{5/} The estimate for 1951 is not yet available.

^{6/} Includes heads, second heads, and screenings, but excludes brewer's rice.

the South and October 1 in California) were the equivalent of 2.16 million cwt. and production the equivalent of 29.03 million cwt. ^{7/} Civilian food use may be about the same as the 8.78 million cwt. in 1950-51. Nonfood use also will be about the same. With supplies record large, a large reserve is available for emergency needs as well as regular exports, and for carry-over at the end of the marketing year.

Table 16 shows milled rice supply and distribution beginning with 1934. This table includes heads, second heads, and screenings, but excludes brewer's rice, and shows the carry-over (August 1 in the South and October 1 in California) of old rice at the time the new rice crop comes on the market. It also shows the breakdown between commercial, military, and USDA exports and shipments.

1952 Rice Acreage Goal Down Slightly

A U. S. rice production goal for the 1952 crop of 42 million cwt. of rough rice has just been announced. With average yields the seeding of 1,950 thousand acres will be required to meet this goal. This is very little below the record 1,962 thousand acres seeded in 1951, and is 14 percent larger than the average acreage for 1946-50.

The current high level of rice production has been made possible because of above normal rice exports, since domestic disappearance does not change materially from year to year. A more active demand for United States rice is already apparent for 1951-52 and a relatively high level is expected to continue into 1952-53. Continuation of high level of exports, however, depends upon the situation in Southeast Asia. Any significant increase in this area would tend to reduce requirements from the United States. Currently exports from Southeast Asia are approximately half the prewar average. Foreign demand for rice also is influenced by the availability of dollars and the price relationships with grains other than rice.

August 1, 1951 stocks of rice in rough rice equivalent totaled 4.1 million cwt. ^{8/} With domestic utilization and exports of rice during 1951-52 now estimated at 43.5 million cwt., the stocks on August 1, 1952 will be about 5.5 million cwt., which would be considerably above average. Under normal conditions stocks of the size expected would be considered excessive. But since there is practically no carry-over of old crop rice into the 1952 marketing year in Southeast Asia, a substantial carry-over as a reserve against possible emergency requirements appears desirable. Also it should be recognized that accurate estimates of requirements for rice from the Far East are not available. It is possible that exports during the 1951-52 marketing season will exceed expectations, thereby reducing the year-end stocks below the indicated 5.5 million cwt.

^{7/} Estimate of November plus an allowance for minor States of Missouri, South Carolina, Arizona, and Florida.

^{8/} Table 19, which is the basis for goals determination, shows the rough-rice supply and distribution, 1946-50 average and annual 1950-51, 1951-52 and projected 1952-53. This table includes brewer's rice as well as other millings and is entirely on an August 1 year. This means that stocks in California are larger than they are on October 1, the beginning of the new marketing year for that State, by the amount of domestic disappearance, exports and shipments in August and September.

If stocks on August 1, 1952 should be as now estimated, if production in 1952 is in line with the national and State goals, and if domestic disappearance and exports during 1952-53 total 42.8 million cwt., as now assumed, stocks of rice in rough equivalent on August 1, 1953 will be about 5 million cwt.

Exports in 1952-53 are tentatively estimated at 16.5 million cwt., rough equivalent, compared with 18.0 million cwt. in 1951-52. It should be pointed out, however, that the figures for 1951-52 includes approximately 2 million cwt., which were sold for export but not lifted before August 1. Imports, which consist mainly of brewer's rice, are relatively unimportant.

In the announcement of the national rice production goal, it was pointed out that "It appears that the present acreage available for rice production exceeds our probable long-time requirements, and producers should be discouraged from developing new rice areas. If international conditions should improve, it is believed that foreign demand for U. S. rice eventually will decline from present high levels. However, no substantial reduction in the production of rice is recommended for 1952 because of the possibility that the United States may be called upon to meet critical needs during or immediately following the present period of conflict in the Orient."

World Rice Trade Increased in 1950
May Increase Further in 1951 9/

International trade in rice increased 5 percent in 1950 from the preceding year. Although world rice exports have risen steadily since World War II, trade in 1950 was only 47 percent of the prewar average. Total exports, including re-exports, were 9,400 million pounds in terms of milled rice compared with 8,900 million a year earlier, and an average of 20,000 million pounds during the prewar period.

Exporting countries: Trade increased in all continents except Africa and North America. For the first time since the war, the total rice exports of Asia exceeded imports. In fact, all continents were surplus in rice in 1950 except Europe. The principal trade gains occurred in Thailand, Brazil, and Italy, while larger shipments from Indo-China, Ecuador, and the several minor exporting countries contributed to a larger total trade.

Seventy percent of the world exports were from the surplus countries of Asia. Trade movement from these nations totaled approximately 6,600 million pounds in terms of milled rice compared with 6,200 million in the year before. Thailand's exports showed a pronounced gain from the year before and were the largest since 1939; thus that country was the leading exporter of rice. Burma's exports, approximately the same as those of a year earlier, were again at only 40 percent of prewar. Indo-China's, though slightly larger than in 1949, were only 8 percent of the former level.

Korea entered the export picture for the first time since World War II and exported nearly 200 million pounds to Japan before the June invasion. These exports exceeded considerably the volume of rice that it was necessary to import later in 1950 as a result of the war. Taiwan's (Formosa) exports as reported officially were relatively small, especially compared with prewar levels.

9/ From Foreign Crops and Markets, September 24, 1951, published by the Office of Foreign Agricultural Relations, USDA.

North America was the next principal source for rice in 1950. Exports from the United States, the Western Hemisphere's largest exporter, and from Mexico, were down slightly from 1949. Brazil and Ecuador ranked as the hemisphere's next largest exporters. The increased trade of these countries as well as in minor exporting countries in South America raised that continent's total above the preceding year. Exports, however, were not so large as during the war and early postwar period.

Egypt's exports were down nearly one-half from 1949, but were above the prewar average. Italy's trade increased over the relatively large volume exported in 1949 and also was substantially above the prewar level. Although official trade data for Australia's 1950-51 fiscal year are not yet available, reports indicate an increase of as much as 30 percent from the preceding year.

Importing countries: Japan in 1950 became the world's largest importer, taking rice from all over the world from such countries as Thailand, Burma, South Korea, China, and Manchuria in Asia, from the United States and Mexico in the Western Hemisphere, and from Egypt and Belgian Congo in Africa.

Imports into India, normally the leading importer, were the smallest in years. Ceylon and the Malayan Federation imported more than a billion pounds each, but nevertheless imports into these countries remained less than before the war. Indonesia, China, Pakistan, British Borneo, and Portuguese India in the Far East, as well as Syria and Lebanon, Saudi Arabia and Jordan in the Middle East, took sizeable quantities.

Rice was imported in increased volume in Germany, the Netherlands, France, the United Kingdom, Switzerland, Belgium, Sweden, and Portugal. Europe's rice was obtained primarily from Italy, Thailand, Brazil, Egypt, Burma, and the United States.

World rice trade in 1951: The world rice trade in 1951 is expected to show some increase from 1950, primarily in Asia's surplus countries, Thailand, Burma, and Indochina. Exports from Pakistan and China also are expected to raise the total trade. Exports from the other countries may be about the same as in 1950 or perhaps slightly larger.

Rice Stocks Small in Far East

Stocks of rice in the important deficit areas of the Far East at the beginning of the 1951 marketing year were very small and production indicated for 1951 is not large enough to increase the carry-over at the beginning of the 1952 marketing year. Accordingly, any improvement in the situation will need to come from 1952 rice production. This is not promising. The only country in which a marked short-term increase in production could take place is in Indo-China, and this is dependent upon improvement in the internal situation in that country.

1951 ^{7/}	396,304	993,598	(40,000)	1,429,902									

^{1/} Includes flour and products in terms of wheat.

^{2/} Prior to 1937 some new wheat included; beginning with 1937 only old crop wheat is shown in all stocks positions. The figure for July 1, 1937, including the new wheat, is 102,8 million bushels, which is used as year-end carry-over in the 1937-37 marketing year.

^{3/} Imports include full-duty wheat, wheat imported for feed, and dutiable flour in terms of wheat. They exclude wheat imported for milling in bond and export as flour, also flour free for export.

^{4/} Includes procurement for both civilian relief feeding and for military food use; military takings for civilian feeding in occupied areas measured at time of procurement, not at time of shipment overseas.

^{5/} Exports as here used, in addition to commercial exports, include U.S.D.A. flour procurement rather than deliveries for export. Beginning with 1941-42, deliveries for export (actual exports, including those for civilian feeding in occupied areas) of wheat, flour, and other products, in million bushels, were as follows: 27.9; 27.8; 42.6; 144.7; 391.8; 397.7; 487.0; 504.1; 299.1; and for 1950-51, 365.8.

^{6/} To Alaska, Hawaii, Puerto Rico, Guam, Samoa, Virgin Islands, and Wake Island.

^{7/} Preliminary.

Terminal stocks (Commercial) are reported by the Production and Marketing Administration. Stocks owned by the Commodity Credit Corporation not included by position are reported by CCC. Stocks in other positions are estimated by the Crop Reporting Board.

1/ October 1 stocks for earlier years as well as for other quarters are shown in The Wheat Situation, issue of December 1948-February 1949, page 16. 2/ Includes all off-farm storages not otherwise designated. 3/ Wheat owned by CCC and stored in bins or other storage owned or controlled by CCC; also CCC-owned grain in transit and in Canadian elevators. Other wheat owned by CCC as well as wheat outstanding under loan is included in other stocks positions.

Total disposition	107,921	140,535	138,152	151,153	
Difference, unaccounted ^{4/}	+ 4,070	+ 509	- 4,046	- 1,275	

Compiled by the Crop Reporting Service from official Government released and information obtained from the following: State and Federal Grain Inspection Divisions, Commodity Credit Corporation, U. S. Department of Commerce, Army Port of Embarkation, all railroads operating in the Northwest, and grain dealers, flour millers, and feed millers located in the Northwest.

- ^{1/} Includes estimate of wheat purchased for feed by farmers from other farmers, but does not include mill-run or other residuals commonly used in prepared feeds.
^{2/} Partly estimated.
^{3/} Inspected grain exports.
^{4/} Difference between total supplies and total disposition; plus sign indicates total supplies exceed total disposition, negative sign indicates total disposition exceeds total supplies.

1/ Basis Census population adjusted for underenumeration of children under 5 and for members of the armed forces not eating out of civilian supplies. Consumption determined by adding flour imports to flour production and by deducting the following flour and products in terms of flour: Exports and shipments, military procurement, breakfast food produced in the flour milling industry. For further details on method of determination of flour consumption see The Wheat Situation, August-September 1951, pages 11-15.

2/ Bureau of Census. Includes estimates for 1940-44 which were developed by Bureau of Census in cooperation with BAE.

3/ Estimated flour equivalent of farm wheat ground for flour, or exchanged for flour, as reported by BAE.

4/ 100 pounds.

Data from U. S. D. A. Production and Marketing Administration, Department of Commerce, Department of National Defense, as well as from the Bureau of Agricultural Economics.

1/ Unmilled rice is converted on the basis of pounds of milled rice (heads, second heads, and screening, excluding brewers', produced annually from 100 pounds of rough rice, converted separately for Southern States and from California. For the 5 years ended July 1950, 100 pounds of rough rice produced an average of 65.9 pounds of such milled rice.

2/ Supply and domestic distribution includes California on an October 1 year.

3/ Stocks on farms, in country warehouses, and in mills, and in addition includes U. S. D. A. holdings outside of mills, in million bags as follows: 1.06 in 1943, 1.79 in 1944, 0.25 in 1945, 0.37 in 1946, 0.16 in 1947, 0.01 in 1948, 0 in 1949, 0.12 in 1950 and 0.03 in 1951. Stocks are old crop on hand August 1 in Southern States and October 1 in California.

4/ Civilian food disappearance of commercially milled rice produced from domestic grain plus rice used on farms where grown and by custom mills for local consumption, adjusted for military procurement and use in broken rice by brewers. Thus, consumption data represent the year rice enters trade channels rather than the time of actual human consumption. In some years large stocks are held by wholesalers and retailers, while in other years such stocks are small.

5/ Rice used by brewers other than brewers' rice as such, which is not included in this table.

6/ Preliminary.

7/ Excludes imports.

8/ Prior to 1941 exports and shipments are on marketing-year basis (August-July for Southern States and October-September for California). Beginning with 1941, exports and shipments are on a July year; complete figures are available for such a year, whereas they are not for an August year.

9/ Includes exports of rough rice in terms of milled equivalents.

10/ Excludes shipments by military for civilian relief feeding.

11/ Procured for both civilian relief feeding and for military food use; military takings for civilian feeding in occupied areas measured at time of procurement, not at time of shipment overseas.

12/ Balancing item results for drying loss, waste, differences arising from the use of July-year exports and shipments, and error in data and conversion.

Table 17. - Rice, rough: Acreage seeded, yield, and production, Southern States, California, and United States, 1919-51

1/ U. S. monthly prices are the result of weighting monthly State prices by production. U. S. marketing-year prices are the result of (1) weighting State monthly prices by monthly sales to obtain State marketing-year averages, and (2) weighting the State marketing-year averages by total sales for each State.
 2/ Preliminary.
 3/ Data from Production and Marketing Administration. Prior to May 18, 1942, California Pearl was California-Japan.
